Submitted (DEC-1997) to the SWISS-PROT data bank.
-!- FUNCTION: THIS PROTEIN BELONGS TO THE HISTONE LIKE FAMILY OF
PROKARYOTIC DNA-BINDING PROTEINS WHICH ARE CAPABLE OF WRAPPING
DNA TO STABILLEE IT, AND PREVENT ITS DENATURATION UNDER EXTREME
BNVIRONMENTAL CONDITIONS (BY SIMILARITY).
-!- SIMILARITY: BELONGS TO THE BACTERIAL HISTONE-LIKE PROTEIN FAMILY.

Submitted (APR-1998) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: THIS PROTEIN BELONGS TO THE HISTONE LIKE FAMILY OF
PROKARYOTIC DNA-BINDING PROTEINS WHICH ARE CAPABLE OF WRAPPING
DNA TO STABILIZE IT, AND PREVENT ITS DENATURATION UNDER EXTREME
ENVIRONMENTAL CONDITIONS (BY SIMILARITY).
-!- SIMILARITY: BELONGS TO THE BACTERIAL HISTONE-LIKE PROTEIN FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gavino V.H., Fallon A.M.;

"Aedes mosquitoes ribosomal protein S6 cDNA.";

"Aedes mosquitoes ribosomal protein S6 cDNA.";

Submitted (MAY-1999) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: MAY PLAY AN IMPORTANT'ROLE IN CONTROLLING CELL GROWTH

-!- AND PROLIFERATION THROUGH THE SELECTIVE TRANSLATION OF PARTICULAR

CLASSES OF MRNA (By similarity).

-!- FTM: Ribosomal protein S6 is the major substrate of protein

kinases in eukaryote ribosomes (By similarity).

-!- SIMILARITY: BELONGS TO THE S6E FAMILY OF RIBOSOMAL PROTEINS.
                                                                                                                                                                                                                                                                 Gaps

Gavino V.H., Fallon A.M.;

Submitted (MAY-1999) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: MAY PLAY AN IMPORTANT ROLE IN CONTROLLING CELL GROWTH
AND PROLIFERATION THROUGH THE SELECTIVE TRANSLATION OF PARTICULAR

CLASSES OF MRNA (By similarity).

-!- PTM: Ribosomal protein $6 is the major substrate of protein

kinases in eukaryote ribosomes (By similarity).

-!- SIMILARITY: BELONGS TO THE $6E PAMILY OF RIBOSOMAL PROTEINS.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight of a copolymer (CP), which has an identified molecular weight of and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatizamer acetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune becompositis, autoimmune thyroiditis, autoimmune vecetinits, contact sensitivity disease, diabetes mellitus, Graves disease, Gulliain-Barre's syndrome, Hashimcto's disease, idiopathic myxoedema, myasthenia gravis, psyndrome, Hashimcto's disease, idiopathic myxoedema, myasthenia gravis, psyndrome, pempigus vulgaris, or systemic lupus erythematosus. Mediated-mediated diseases which can be treated include host-versus-graft disease, graft-versus-shost disease, and delayed-type hypersenaitivity. The polypeptides of the invention have defined molecular weights and phylacial properties which are analogous to molecular melayer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

AAY92571 to AAY92577 represent specifically claimed copolymer molecular weight TV-marker polypeptides (I) for determining the molecular weight to describes polypeptides (I) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for CP polypeptides of the invention are used as molecular weight markers for CP glatiramer acetate related tetrapolymers. The polypeptides may also be used for treated preventing immune diseases in a mammal. Autoimmune CP diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple collections, autoimmune ophoritis, osteoarthritis, autoimmune to sclerosis, theumatoid arthritis, osteoarthritis, autoimmune cophoritis, autoimmune thyroiditis, autoimmune cophoritis, context sensitivity disease, diabetes mellitus, carves disease, duillain-Barre's syndrome, Hashimoto's disease, idiopathic comparated molecular weightes and physical properties which are analogous to continue molecular weightes and physical properties which are analogous to continue molecular weightes and physical properties which are analogous to continue molecular weightes and physical properties analogous to continue molecular mellinum continum continum continum continument continued continument continument continument continument continument continument continument continument continume

weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (I) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and amino acid composition corresponding to the copolymer. The polypeptides markers for glatiramer acctate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatorid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune oophoritis, autoimmune thyroiditis, autoimmune vecetinits, contact sensitivity disease, diabetes mellitus, Graves purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Gullain-Barre's syndrome, Hashimoto's disease, idiopathic myxoedema, myasthenia gravis, psyndrome, Hashimoto's disease, idiopathic myxoedema, myasthenia gravis, psoriasis, pemphigus vulgaris, or systemic collis, contact sensitivity disease, while are a syndrome, Hashimoto's disease, idiopathic myxoedema, myasthenia gravis, psoriasis, pemphigus vulgaris, or systemic collis, contact sensitivity disease which can be treated include by the contact sensitivity disease, diabetes mellitus, Cromator sensitivity disease, diabetes mellitus, or systemic lugar erythemetogus Mediated emediated diseases which can be treated include the contact sensitivity disease which can be treated include the contact sensitivity disease which can be treated include the contact sensitivity disease which can be treated include the contact sensitivity disease which can be treated the contact sensitivity disease.
inflammatory condition; multiple sclerosis; rheumatoid arthritis; cothn's disease; chronic immune thrombocytopaenia purpura; colitis; diabetes mellitus; graves disease; Guillain-Barre's syndrome; psoriasis; Hashimoto's disease; idiopathic myxoedema; myasthenia gravis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ç
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to AAY82577 represent specifically claimed copolymer molecular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 include host-versus-graft disease, graft-versus-host disease, and delayed-type hypersensityity. The polypeptides of the invention have defined molecular weights and physical properties which are analogous glatiramer acetate molecules, which makes them ideal for use as

Weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (I) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight of a copolymer (CP), which has an identified molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer acetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune hyproidatis, autoimmune mammal and an ammune planting than an ammune and ammune and an ammune and an ammune and an ammune and an ammune an uveoretinitis, Crohn's disease, chronic immune thrombocytopeenia uveoretinitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic myxoedema, myasthenia gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated-mediated diseases which can be treated include host-versus-graft disease, graft-versus-host disease, and delayed-type hypersensitivity. The polypeptides of the invention have defined molecular weights and physical properties which are analogous to glatiramer acetate molecules, which makes them ideal for use as

The present invention describes polypeptides (I) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight of a copolymer (CP), which has an identified molecular weight of a polypeptides of the invention are used as molecular weight markers for glatiramer acetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune physicialismune chycolditis, autoimmune anaemia, autoimmune thyroiditis, autoimmune

Mediated-mediated diseases which can be treated delayed-type hypersensitivity. The polypeptides of the invention have defined molecular weights and physical properties which are analogous to glatiramer acette molecules, which makes them ideal for use as

To improve the expression of rCOP-1 polypeptides in E. coli, genes coding for rCOP-1-77 were subcloned from pREV 2.1 to pBG3-2deltaN (deposit: 20.NOV-1948 US469100), NRRL B-15910), a plasmid used to express Protein A. The resulting plasmids encode fusion proteins consisting of beta-glucuronidase, Protein A, and rCOP-1 sequences.

A methionine residue occurs between the Protein A and rCOP-1 sequences, originaling from the 5' linker sequence, in order that the COP-1 polypeptide may be cleaved from the fusion protein.

C COP-1-77 contains oligonucleotide duplexes incoding the following segments: YKK, BER, KAK, And AAA. The N-terminal alanine residue is left behind following CNP releaved of the fusion protein.

The product prevents or arrests experimental autoimmune encephalomyelitis. They are used to prevent, arrest or control a demyelinating disorder, e.g. multiple sclerosis. They may also be used as additives to hair care products to confer beneficial effects on damaged hair or as supplements for diets deficient in

The resulting plasmids encode fusion proteins consisting of beta-glucuronidase, Protein A, and rCOP-1 sequences. A methionine residue occurs between the Protein A and rCOP-1 sequences, originating from the 5' linker sequence, in order that the COP-1 polypeptide may be cleaved from the fusion protein. rCOP-1-19 contains oligonucleotide duplexes incoding the following segments: YKK, AAE, KAK, EKA, REA, ARA KEA, and AAA. The Neterminal alanine residue is left behind following CNBr cleavage of the
                                                                                                                  Gaps

```
The present invention relates to a transporter system for delivering nucleic acid to a cell. The system comprises a nucleic acid binding complex, consisting of a binding molecule bonded non-covalently to the nucleic acid, and covalently to a surface ligand, and a lytic agent. The nucleic acid, and covalently to a surface ligand, and a lytic agent. The binding molecule is spermine or a spermidine derivative. Nucleotide sequences AAA36613-A36652 and peptide sequences AAY36456-Y98500 are used in the construction of the transporter system of the invention. The ransporter system is used in gene therapy, particularly to deliver nucleic acids to hepatocytes, muscle cells or bone forming cells, e.g. for treating cardiovascular disease, cancer, and infection. The cransporter systems are also used to create transgenic animals (as models for human carcinogenesis or disease or for drug testing). Other uses include transforming cells or produce proteins, or transfecting cells in clude transforming cells to produce proteins, or transfecting cells in ligand allows specific targeting of selected cells and tissues. The lytic agent provides for release of the nucleic acid into the cellular interior, from endosomes, without requiring endosomal or lysosomal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  System for transporting nucleic acid into cells, useful e.g. in gene therapy and for generating transgenic animals, comprises binding agent linked to nucleic acid, surface ligand and lytic agent

                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                             엄
                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a nucleic acid transport system (NTS) for delivering nucleic acid into a cell. The NTS contains but is not limited to 5 components: (a) the nucleic acid or a macromolecule to be delivered; (b) a moiety that recognises and binds to a cell surface receptor or antigen or is capable of entering a cell through cytosis; (c) a nucleic acid or macromolecular molecule binding moiety; (d) a moiety that is capable of moving or initiating movement through cytosis; (c) a nucleic complex or (e) a lysis moiety that enables the transport of the entire complex or (e) a lysis moiety that enables the transport of the entire complex or from the cell surface directly into the cytoplasm of the cell. The NTS call into the cytoplasm of the cell. The NTS call into the cytoplasm of the cell as the nucleus of specific cells. The NTS can be used to treat disorders by targeting transgenic animals for assessing human disease, such as cancer, in an example of the coll of various nucleic acide to be studied by targeting specific expression into specifically targeted tissue culture cells. The Collysis and services of specific expression into specifically targeted tissue culture cells. The collysis agent within the NTS avoids the problem of endosomal/lysosomal

The nucleic acid transporter system uses nucleic acid binding complexes containing surface ligands which are capable of binding to a cell surface receptor and entering the cell through cycosis. The compounds of the invention are either ligands, binding molecules (surface ligands), lysis agents, spacer molecules or their intermediates. The ligands, binding molecules, lysis agents and spacer molecules are used in nucleic acid transporter systems to deliver nucleic acid into specific cells e.g. in gene therapy to deliver nucleic acid into hepatocytes, muscle cells or bone forming cells.
                                                                                                                                                                                                    Nucleic acid transport, cytosis; ligand; lysis agent; spacer molecule; gene therapy; hepatocyte; muscle; bone forming cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  animals

The complexes are simultaneously bound to the nucleic acid transporter system can also be used in a method for the in vivo targeting of the insertion of DNA into a cell. It can system can be used in processes for producing transformed cell lines. The system can be used to deliver a variety or proteins and polypeptides, such as hormones, growth factors, enzymes, clotting factors, such subpressors, viral antigens, parasitic antigens, and bacterial antigens. The transporter system uses lysis agents to overcome the problems of endosomal/lysosomal degradation seen with prior art systems.
                                                                                                                                                                                                                                                                                                                                                                       Nucleic acid delivery; nucleic acid transporter system; hormone; enzyme; growth factor; clotting factor; apolipoprotein; receptor; drug; oncogene; tumor antigen; tumor suppressor; viral antigen; parasitic antigen; bacterial antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel system (I) for delivering a nucleic acid
                   28
                                  Nucleic acid transporter system for delivering nucleic acid into a cell, useful for delivering proteins and polypeptides to cells, including growth factors, enzymes, hormones, and tumor suppressors

The invention provides a method for the diagnosis, prevention and treatment of ulcerative colitis (UC) using histone H1-like antigen, a portion antigen or a Bacteroides antigen as a target antigen. The novel method of diagnosing UC in a subject suspected of having inflammatory bowel disease (IBD) comprises: (1) obtaining a sample from the subject; (2) contacting the sample with a histone H1-like antigen, or perinnclear anti-neutrophil cytoplasmic antibody (PANCA)-reactive fragment, to form a complex of the histone H1-like antigen, and (3) detecting the resence or absence of the complex; where the presence of the complex indicates that the subject has UC. The pANCA-reactive histone H1-like in the antigen, porin antigen and Bacteroides antigen are useful in the antigen, prevention and treatment of UC. The methods can also be used for identifying agents useful for treating UC. The present sequence represents a M. tuberculosis histone H1-like antigen.

                                                                                                                                                                                                                                                                                                                                                                                                      The invention provides a method for diagnosing ulcerative colitis in a subject suspected of having inflammatory bowel disease. The method comprises reacting a patient sample with a porin antigen that is immunologically reactive with pANCA (perinclear anti-neutrophil cytoplasmic antibodies) and detecting formation of a Ag-pANCA complex as indicative of ulcerative colitis. The method is used to diagnose ulcerative colitis or susceptibility to it. The present sequence represents a histone H1-like protein of M. tuberculosis, designated 214.
                                                                                                                                                                                                                                                                                                                                        Diagnosing ulcerative colitis or susceptibility, by detecting complex formation between microbial porin antigen and perinuclear anti-neutrophil cytoplasmic autoantibodies -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            111 AKKVAK--KAPAKKATKAAKKAATKAPAKKAATKAPAKKAATKAPAKKAVKATKSPAKKV 168

```

```
The present sequence represents the Mycobacterium bovis BCG strain mycobacterium DNA binding protein 1 (MDP1), which has immunogenicity against pathogenic acid-fast bacteria. The MDP1 protein can be used for diagnosis and treatment of diseases involving pathogenic acid-fast bacteria, such as tuberculosis, Mycobacterium avium intracellular complex (MAC) and Hansen's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New Mycobacterium DNA binding protein 1 immunogenic for pathogenic acid-fast bacteria for diagnosis, treatment and prevention of diseases

AAR84565-R84569 are polypeptides of the TCR27 protein of T.cruzi
The proteins are all fusion products with glutathione-S-transferase
(GST) and some contain a linker sequence. The TCR27 protein comprises
a 95 amino acid (aa) N-terminal region; 69 repeats of a highly
conserved 14 as sequence, the Ag8 polypeptide contg. 15 of the 69
encodes the GST sequence, the Ag8 polypeptide contg. 15 of the 69
repeat units and also contains a linker sequence. The TCR27
polypeptides of the invention are useful for the diagnosis of Chagas
continuous and also contains a linker sequence. The TCR27
polypeptides of the invention are useful for the diagnosis of chagas
continuous antibodies; or for blood screening. The TCR27 protein
has epitopes to which meat T.cruzi infected individuals have
anti-T.cruzi antibodies; or for blood screening. The TCR27 protein
has epitopes to which meat T.cruzi infected individuals have
antibodies. The TCR27 polypeptides will not react with serum from
patients with leishmaniasis, schistosomiasis, or autoimmune disease
and are hence less likely to cause false positives in diagnosis.
                                                                                                                                                                                                                                                                                          New polypeptide(s) from the TCR27 protein of Trypanosoma cruzi - s
immunoassay reagent for specific diagnosis of Chagas disease, also
related nucleic acid and transformed cells
                                                                                                                                                                                                                                                                                                                                                                                       Disclosure; Page 44-45; 68pp; English.

Sequence 95, Application US/09820843A
Publication No. US20030039963A1
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Council Of Scientific and Industrial Research
TITLE OF INVENTION: A COMPUTATIONAL METHOD FOR THE IDENTIFICATION OF CANDIDATE PROTEIN
TITLE OF INVENTION: USEFUL AS ANTI-INFECTIVES
FILE REFERENCE: 063915
CURRENT APPLICATION NUMBER: US/09/820,843A

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
